

TRAINING GENERATIVE ADVERSARIAL NETWORKS WITH BINARY NEURONS BY END-TO-END BACKPROPAGATION

Hao-Wen Dong and Yi-Hsuan Yang

OUTLINES

- ◇ **Backgrounds**
 - ◇ **Generative Adversarial Networks**
 - ◇ **Binary Neurons**
 - ◇ **Straight-through Estimators**
- ◇ **BinaryGAN**
- ◇ **Experiments & Results**
- ◇ **Discussions & Conclusion**

BACKGROUNDS

GENERATIVE ADVERSARIAL NETWORKS

- ◇ **Goal**—learn a **mapping** from the prior distribution to the data distribution [2]

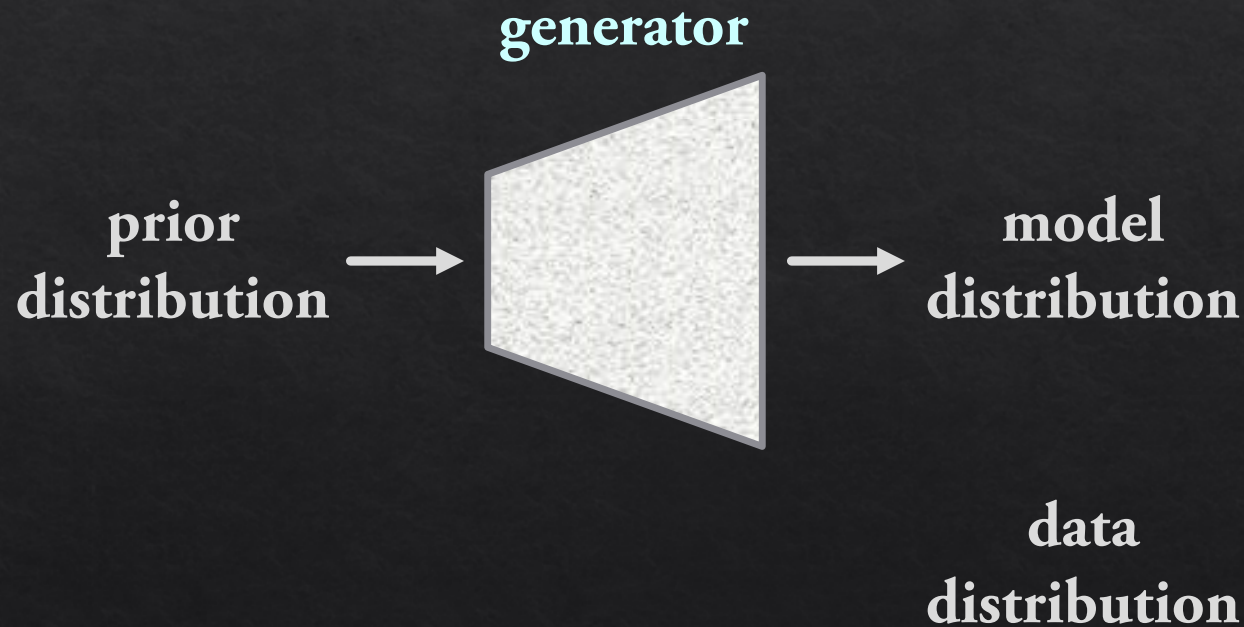

GENERATIVE ADVERSARIAL NETWORKS

- ◇ **Goal**—learn a **mapping** from the **prior distribution** to the **data distribution** [2]

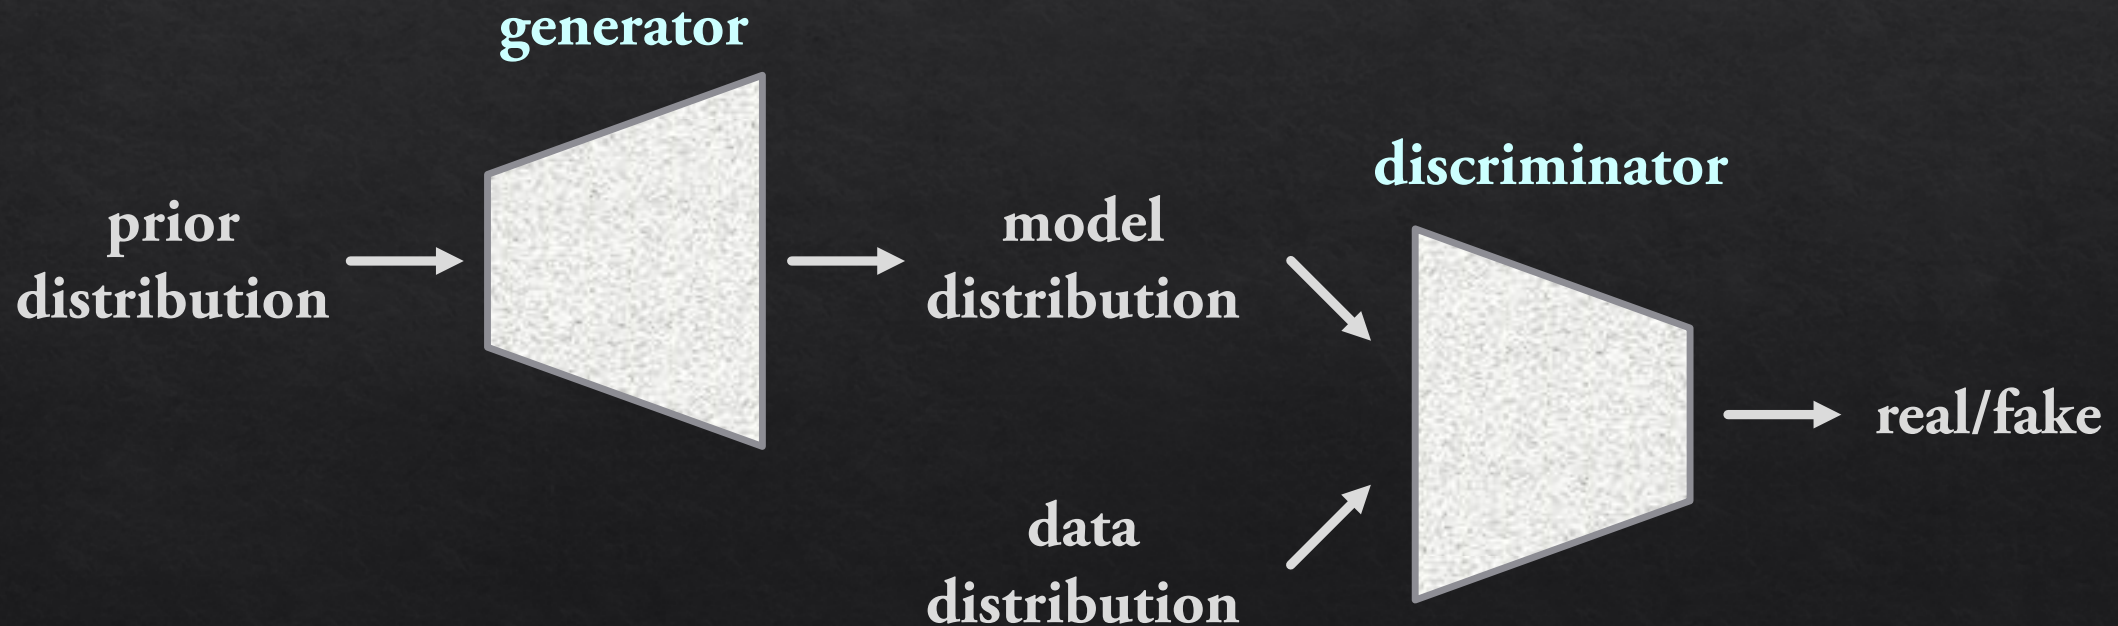

GENERATIVE ADVERSARIAL NETWORKS

- ◇ Use a deep neural network to learn an **implicit** mapping

GENERATIVE ADVERSARIAL NETWORKS

- ◆ Use another deep neural network to provide **guidance/critics**

BINARY NEURONS

◇ **Definition:** neurons that output **binary-valued** predictions

BINARY NEURONS

- ◇ **Definition:** neurons that output **binary-valued** predictions
- ◇ **Deterministic binary neurons (DBNs):**

$$DBN(x) \equiv \begin{cases} 1, & \text{if } \sigma(x) > 0.5 \\ 0, & \text{otherwise} \end{cases} \quad \text{(hard thresholding)}$$

BINARY NEURONS

- ◇ **Definition:** neurons that output **binary-valued** predictions
- ◇ **Deterministic binary neurons (DBNs):**

$$DBN(x) \equiv \begin{cases} 1, & \text{if } \sigma(x) > 0.5 \\ 0, & \text{otherwise} \end{cases} \quad (\text{hard thresholding})$$

- ◇ **Stochastic binary neurons (SBNs):**

$$SBN(x) \equiv \begin{cases} 1, & \text{if } z < \sigma(x) \\ 0, & \text{otherwise} \end{cases}, \quad z \sim U[0, 1] \quad (\text{Bernoulli sampling})$$

BACKPROPAGATING THROUGH BINARY NEURONS

- ◇ Backpropagating through binary neurons is **intractable**
 - ◇ For DBNs, it involves the nondifferentiable threshold function
 - ◇ For SBNs, it requires the computation of expected gradients on all possible combinations (*exponential to the number of binary neurons*) of values taken by the binary neurons

BACKPROPAGATING THROUGH BINARY NEURONS

- ◇ Backpropagating through binary neurons is intractable
 - ◇ For DBNs, it involves the nondifferentiable threshold function
 - ◇ For SBNs, it requires the computation of expected gradients on all possible combinations (*exponential to the number of binary neurons*) of values taken by the binary neurons
- ◇ We can introduce **gradient estimators** for the binary neurons
 - ◇ Examples include Straight-through [3,4] (*the one adopted in this work*), REINFORCE [5], REBAR [6], RELAX [7] estimators

STRAIGHT-THROUGH ESTIMATORS

- ◇ **Straight-through estimators:** [3,4]
 - ◇ Forward pass—use hard thresholding (DBNs) or Bernoulli sampling (SBNs)
 - ◇ Backward pass—pretend it as an **identity function**

STRAIGHT-THROUGH ESTIMATORS

- ◇ **Straight-through estimators:** [3,4]
 - ◇ Forward pass—use hard thresholding (DBNs) or Bernoulli sampling (SBNs)
 - ◇ Backward pass—pretend it as an identity function
- ◇ **Sigmoid-adjusted straight-through estimators**
 - ◇ Use **the derivative of the sigmoid function** in the backward pass
 - ◇ Found to achieve better performance in a classification task presented in [4]
 - ◇ Adopted in this work

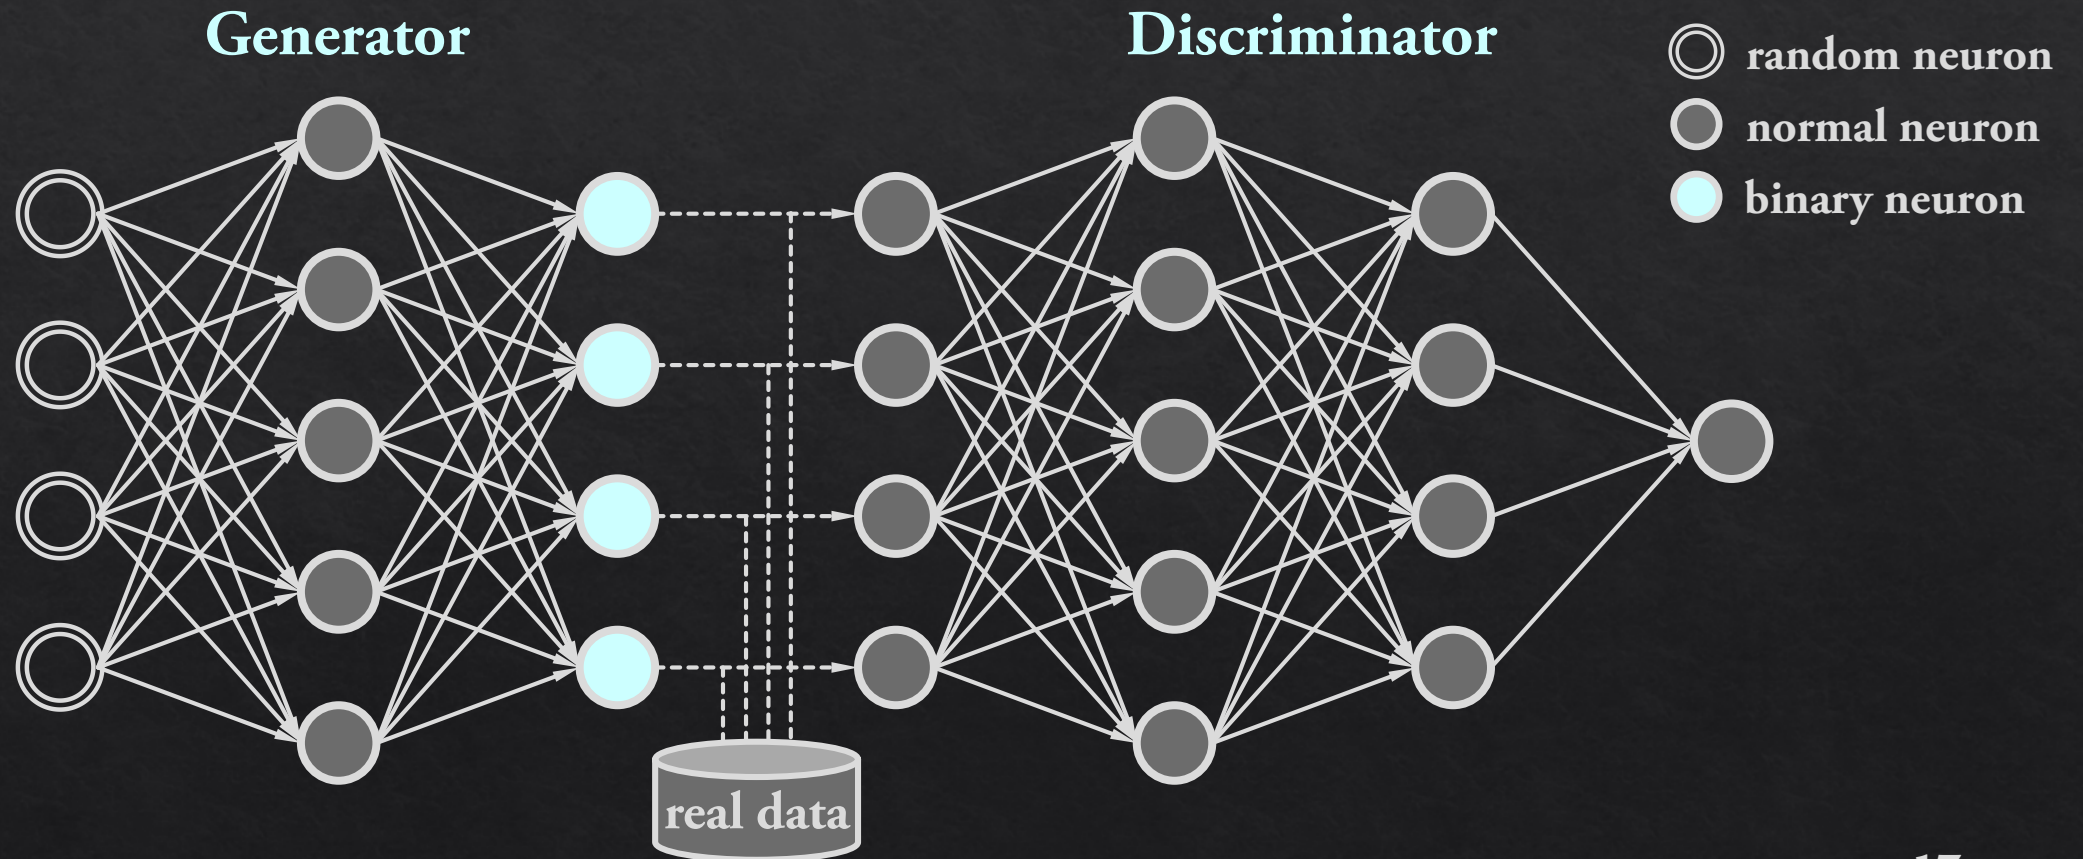

BINARYGAN

BINARYGAN

- ◇ Use **binary neurons** at the **output layer** of the generator
- ◇ Use **sigmoid-adjusted straight-through estimators** to provide the gradients for the binary neurons
- ◇ Train the whole network by **end-to-end backpropagation**

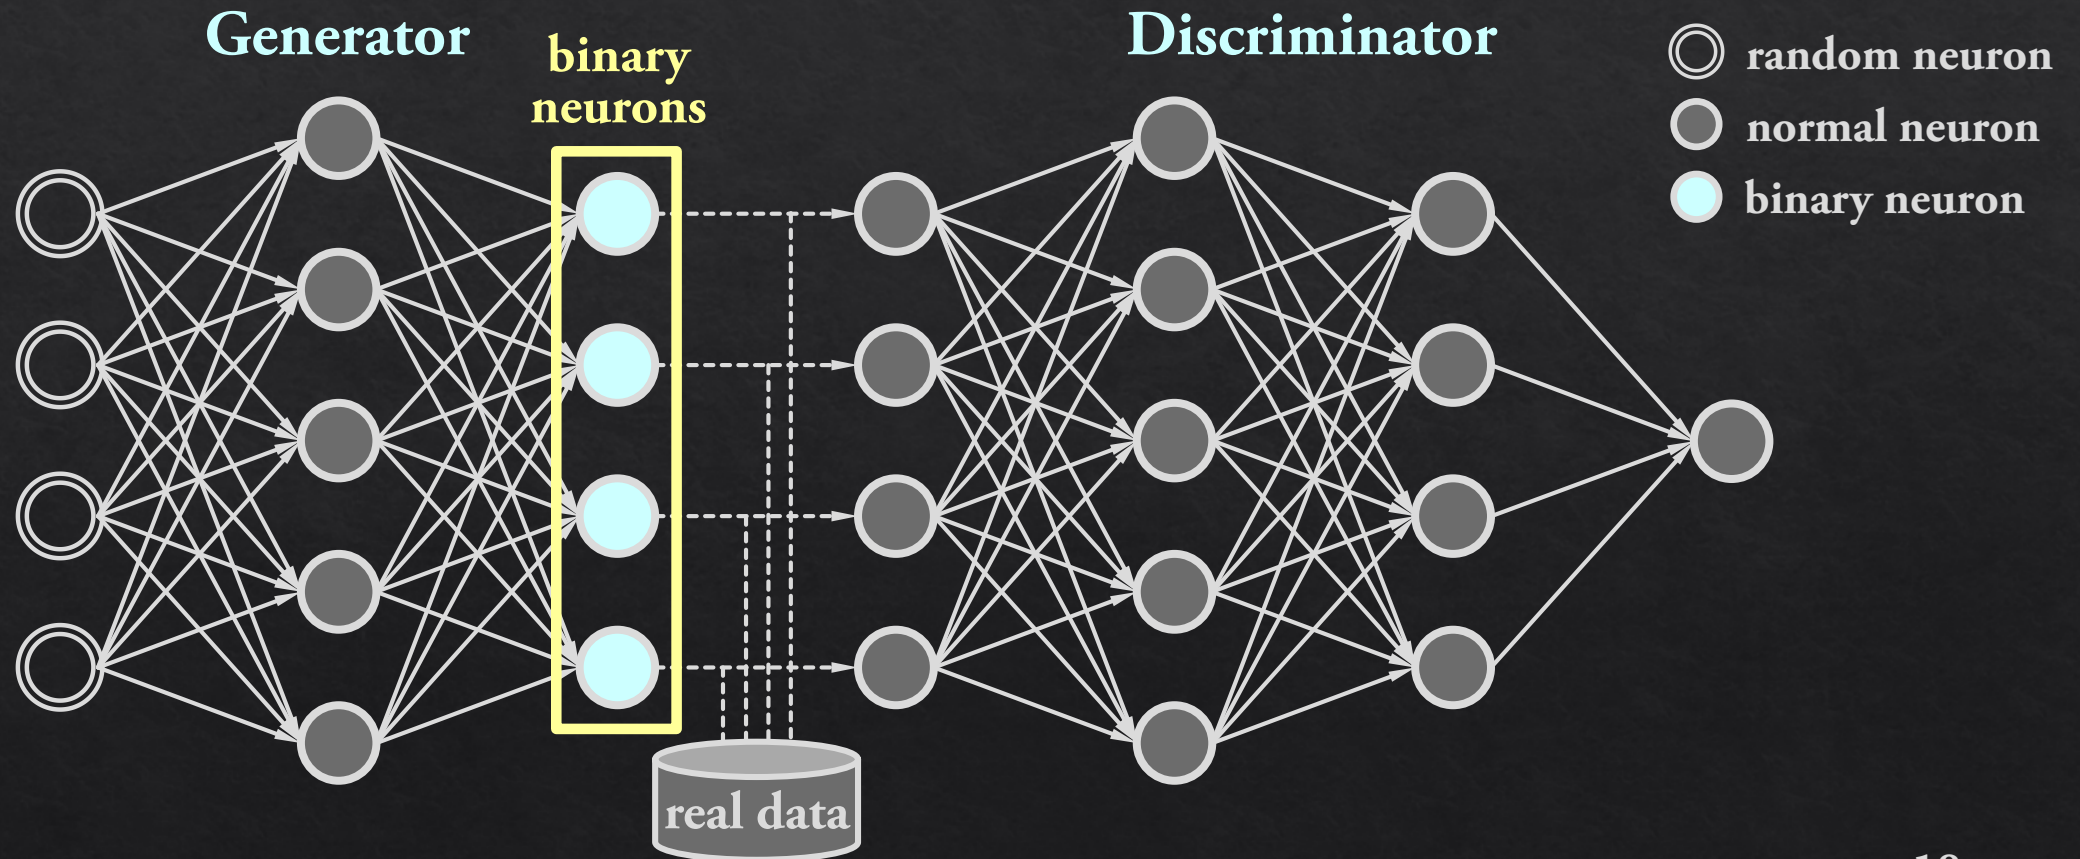

BINARYGAN

(implemented by multilayer perceptrons)

BINARYGAN

(implemented by multilayer perceptrons)

EXPERIMENTS & RESULTS

TRAINING DATA

- ◆ **Binarized MNIST** handwritten digit database [8]
 - ◆ Digits with nonzero intensities \rightarrow 1
 - ◆ Digits with zero intensities \rightarrow 0

Sample binarized MNIST digits

IMPLEMENTATION DETAILS

- ◆ Batch size is 64
- ◆ Use WGAN-GP [9] objectives
- ◆ Use Adam optimizer [10]
- ◆ Apply batch normalization [11] to the generator (but not to the discriminator)
- ◆ Binary neurons are implemented with the code kindly provided in a blog post on the R2RT blog [12]

IMPLEMENTATION DETAILS

- ◇ **Apply slope annealing trick [13]**
 - ◇ **Gradually increase the slopes of the sigmoid functions used in the sigmoid-adjusted straight-through estimators as the training proceeds**
 - ◇ **We multiply the slopes by 1.1 after each epoch**
 - ◇ **The slopes start from 1.0 and reach 6.1 at the end of 20 epochs**

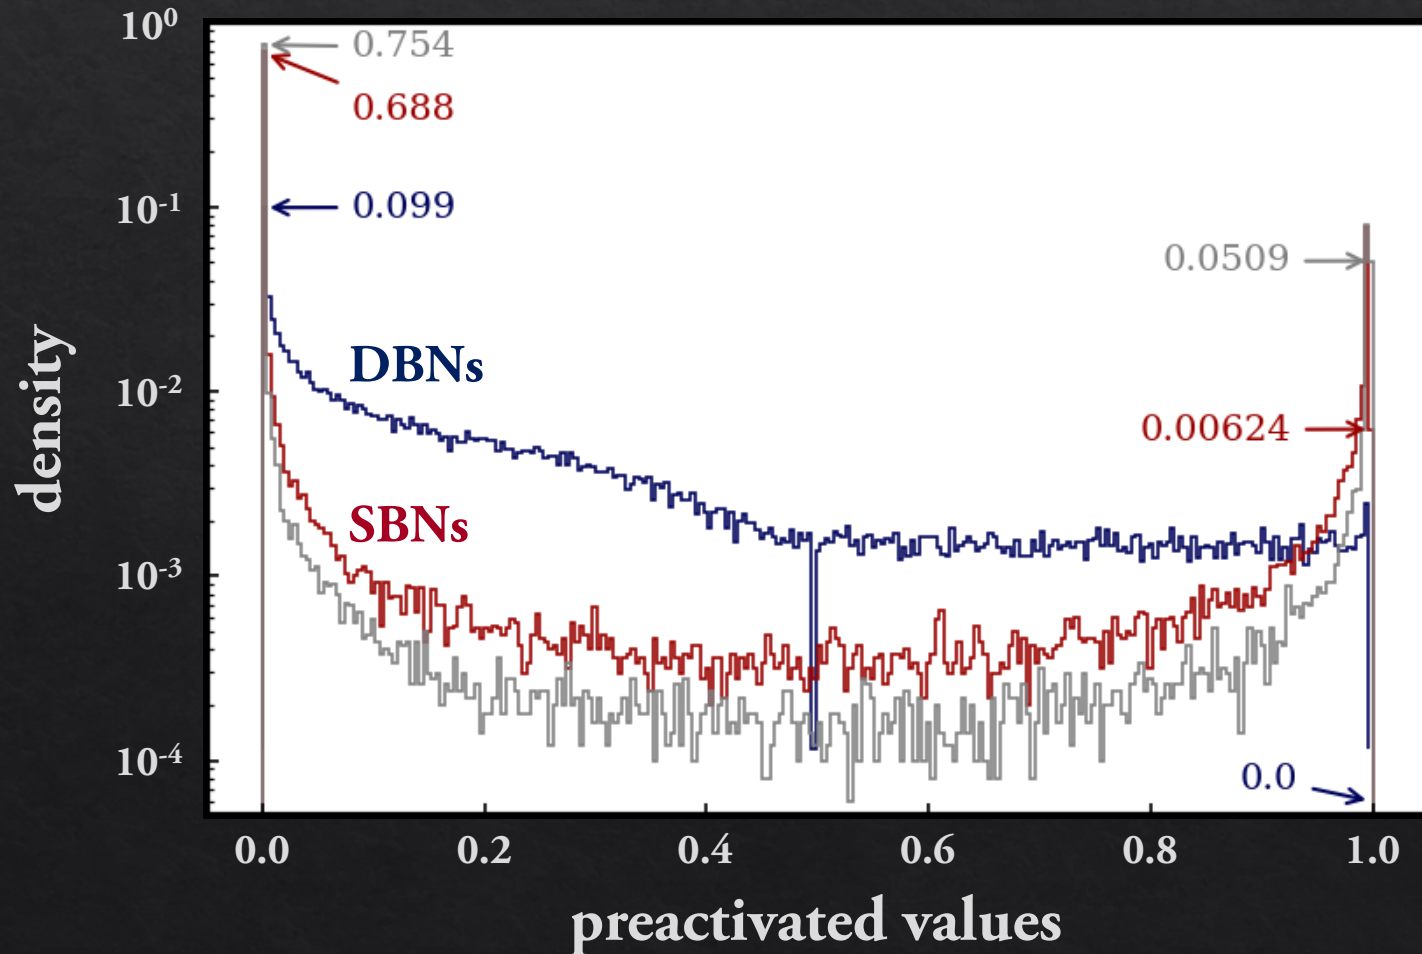

EXPERIMENT I—DBNs vs SBNs

- ◇ DBNs and SBNs can achieve similar qualities
- ◇ They show distinct characteristics on the **preactivated outputs**

EXPERIMENT I—DBNs vs SBNs

Histograms of the preactivated outputs

DBNs

- more values in the middle
- a notch at 0.5 (the threshold)

SBNs

- more values close to 0 and 1

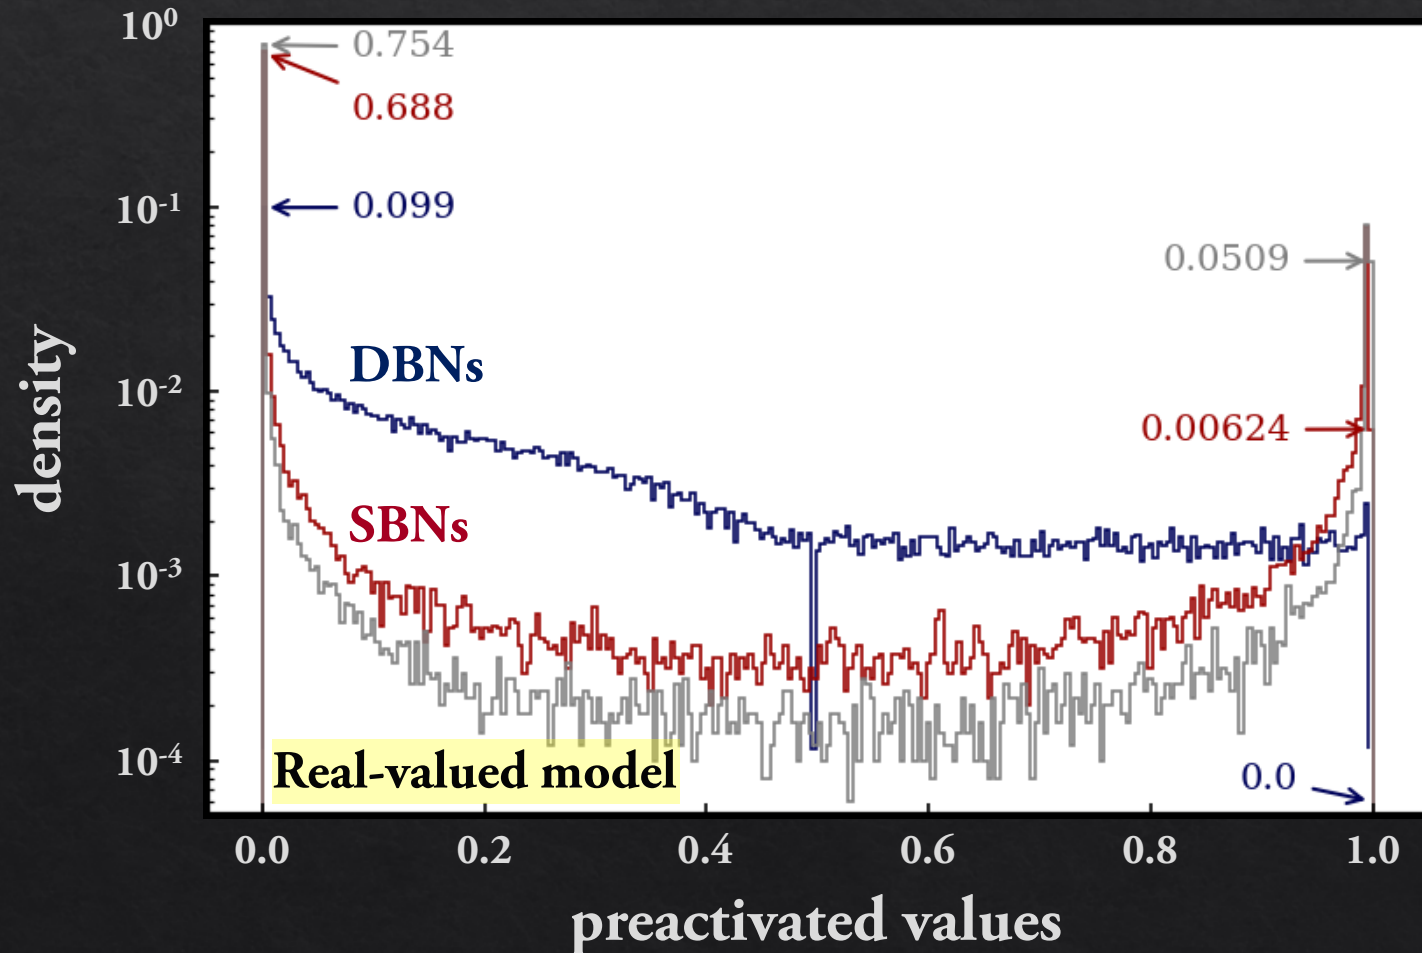

EXPERIMENT II—REAL-VALUED MODEL

- ◇ Use **no binary neurons**
- ◇ Train the discriminator by the **real-valued outputs** of the generator

EXPERIMENT II—REAL-VALUED MODEL

Histograms of the preactivated outputs

DBNs

- more values in the middle
- a notch at 0.5 (the threshold)

SBNs

- more values close to 0 and 1

Real-valued model

- even more U-shaped

EXPERIMENT III—GAN OBJECTIVES

- ◇ WGAN [14] model can achieve similar qualities to the WGAN-GP
- ◇ GAN [2] model suffers from **mode collapse** issue

GAN + DBNs

GAN + SBNs

WGAN + DBNs

WGAN + SBNs

EXPERIMENT IV—MLPs vs CNNs

- ◆ CNN model produces less artifacts even with a small number of trainable parameters (MLP—0.53M; CNN—1.4M)

MLP model

DBNs

SBNs

CNN model

DBNs

SBNs

DISCUSSIONS & CONCLUSION

DISCUSSIONS

- ◇ **Why is binary neurons important?**
 - ◇ Open the possibility of conditional computation graph [4,13]
 - ◇ Move toward a stronger AI that can make reliable decisions

DISCUSSIONS

◆ **Why is binary neurons important?**

- ◆ Open the possibility of conditional computation graph [4,13]
- ◆ Move toward a stronger AI that can make reliable decisions

◆ **Other approaches to model discrete distributions with GANs**

- ◆ Replace the target discrete outputs with continuous relaxations
- ◆ View the generator as agent in reinforcement learning (RL) and introduce RL-based training strategies

CONCLUSION

- ◆ **A new GAN model that**
 - ◆ can generate binary-valued predictions without further post-processing
 - ◆ can be trained by end-to-end backpropagation
- ◆ **Experimentally compare**
 - ◆ deterministic and stochastic binary neurons
 - ◆ the proposed model and the real-valued model
 - ◆ GAN, WGAN, WGAN-GP objectives
 - ◆ MLPs and CNNs

FUTURE WORK

- ◇ Examine the use of gradient estimators for training a GAN that has a **conditional computation graph**
